IBM UNIVERSITY ENGAGEMENT

PROJECT SUBMISSION

"Exploring the Power of Agentic AI with IBM Granite and LangFlow"

AI-Powered Travel Planner Agent

Using IBM Cloud, IBM watsonx.ai, IBM Granite, IBM Bob, Python, Streamlit and IBM cloud lite services

Project Details

Project Title – AI-Powered Travel Planner Agent (Travio Agents)

Domain of Project: Artificial Intelligence, Agentic AI, Cloud Computing and Travel & Tourism

Powered by: IBM watsonx.ai • IBM Bob • IBM Cloud • IBM Granite model • OpenWeatherMap API

Student Name	Recent Passport Photo	Email ID	Mobile Number [WhatsApp]
Stanzin Saskyong Namgail		Stanzin.05216403223@std.ggsipu.ac.in	9797039263

Project Overview:

Travio is an AI travel planning assistant built on IBM watsonx.ai. Powered by the IBM Granite 4.0 H-Small model and live weather data, it generates personalised itineraries, shows real-time weather and destination suggestions, compares transport and stay options, answers travel questions in an AI chat, and produces a trip summary with a pre-travel checklist.

Planned extensions: RAG over verified travel guides, multi-agent orchestration, and real booking integrations.

1. Project at a Glance

Travio is an AI travel planning assistant that turns a traveler's preferences (origin, destination, trip length, group size, travel style, budget and interests) into a personalised day-by-day itinerary. It combines l**ive weather data** from OpenWeatherMap, a curated destination, transport and stay knowledge base, and the **IBM Granite 4.0 H-Small foundation model** running on **IBM watsonx.ai**. Everything is delivered in one Streamlit web app with five tabs: itinerary, weather and destinations, transport and stay, AI chat, and trip summary.

Item	Details
Project title	Travio – AI Travel Planner Agent
Problem addressed	Fragmented, time-consuming trip planning spread across many apps and websites
Core AI approach	Prompt-engineered generation with IBM Granite on watsonx.ai, combined with tool functions that fetch live weather and curated travel data
AI model	IBM Granite 4.0 H-Small (ibm/granite-4-h-small) through the watsonx.ai Runtime, IBM Cloud Dallas (us-south)
Key features	Itinerary generator • live weather & forecast • destination explorer • transport & stay options • AI chat • trip summary & checklist
Expected outcome	A complete, personalised trip plan in minutes instead of hours, with transparent, user-controlled recommendations

2. Problem Statement

Problem Statement: Travel Planner Agent

The Challenge

Travel planning is still a manual, multi-step chore. A traveler reads blogs for ideas, checks the weather in one app, compares transport and hotels on others, looks up visa and safety rules elsewhere, and then stitches everything together in notes or spreadsheets. Every source uses a different format, price and level of trust. The result is wasted time, budget overruns, missed details and trips that do not match the traveler's interests.

Why this problem is significant

- **Scale:** travel and tourism is one of the world's largest industries and most trips are now researched and booked online, so small gains in planning efficiency reach millions of people.
- **Time cost:** planning one multi-day trip commonly means hours of searching across many tabs and apps.
- **Information overload:** reviews, listicles and adverts are mixed with genuine advice, making it hard to know what to trust.
- **Weather and context blindness:** plans are rarely checked against the forecast, so rain or heat can spoil a day that looked perfect on paper.
- **Generic advice:** one-size-fits-all itineraries ignore budget, travel style, group type and interests.

Objective

Build an AI travel assistant on IBM watsonx.ai, using an IBM Granite model, that helps a traveler plan an entire trip through a simple interface. The solution should:

- **Plan** – generate personalised day-wise itineraries from budget, trip length, interests and style.
- **Advise** – show live weather and suggest destinations by travel type and budget.
- **Compare** – outline transport modes and accommodation options for each budget tier.
- **Converse** – answer follow-up questions (visa, food, safety, currency, packing) in an AI chat.
- **Summarise** – produce a trip summary with a budget breakdown, tips and a pre-travel checklist.

Problem statement in one line: Travelers lack a single, trustworthy, easy-to-use assistant that turns their preferences and live conditions into a complete, personalised trip plan in minutes.

3. Target Users and Pain Points

Who are the target users?

User group	Profile	Typical need
Young travelers & students	18–30, budget-conscious, mobile-first	Low-cost itineraries, hostels, trains and buses
Families & couples	Plan holidays for 2–6 people, sometimes with kids or seniors	Safe, comfortable, well-paced plans and stay options
Working professionals	Time-poor, short weekend or business-plus-leisure trips	Fast planning in minutes and a one-click summary
Solo & first-time international travelers	Unfamiliar with local rules and logistics	Visa, safety, weather, currency and local-tips guidance

Pain points Travio solves

Pain point	How Travio addresses it
Hours lost researching across many apps	One sidebar form feeds every tab: itinerary, weather, options, chat and summary in a single app
Generic itineraries that ignore preferences	The Granite prompt is built from the traveler's style, budget, interests, trip length and group size
Not knowing the weather before packing and planning	Weather tab shows live conditions and a forecast for any city from OpenWeatherMap
Hard to compare transport and stay	Transport & Stay tab lists modes with typical cost and a tip, and stays by budget tier with price per night and booking platforms
Unanswered questions (visa, food, safety, currency)	AI Chat answers in context, with one-click quick questions for the chosen destination
Trip details scattered across notes and chats	Trip Summary tab gives a checklist, AI summary with budget breakdown, and a downloadable plan

Why current solutions fall short

- Booking platforms are search-and-filter tools; they do not plan around a traveler's style or the weather.
- Generic chatbots can write an itinerary but have no live data, no structured preference input and may state prices or conditions that are out of date.
- Itinerary apps need every stop entered by hand and rarely combine weather, transport, stay and Q&A in one flow.
- Travel agents are personalised but costly, slower and not available around the clock.

4. Solution Overview

Proposed Solution: AI Powered Travel Planner Agent

What is the proposed solution?

Travio is a Streamlit web application backed by **IBM Granite 4.0 H-Small on IBM watsonx.ai.** The traveler enters preferences once in the sidebar. The app then builds a structured prompt, calls the Granite model through the watsonx.ai Runtime, and returns a personalised plan. Alongside the AI, small tool functions fetch live weather from OpenWeatherMap and serve curated destination, transport and stay data. The traveler stays in control: Travio suggests, the traveler decides.

Core features (Key Agents involved)

Feature	What it does
Itinerary Planner	Granite generates a day-by-day plan (morning, afternoon, evening), a travel tip and an estimated daily spend for each day, plus a packing checklist. The plan can be downloaded.
Weather & Destinations	Live current weather and forecast for any city via OpenWeatherMap. A destination explorer suggests places by travel type (beach, mountain, cultural, adventure, city) and budget.
Transport & Stay	Compares flights, trains, buses and car rental with typical cost ranges, and lists accommodation types, nightly prices and booking platforms by budget tier.
AI Chat Assistant	Multi-turn chat with Granite for visa, food, safety, currency, packing and local tips. Keeps the last few messages as context and offers one-click quick questions.
Trip Summary	Pre-travel checklist and an AI-written summary with must-do experiences, etiquette, budget breakdown and best season. The full plan can be downloaded.

How the solution solves the problem and delivers value

- **Speed:** a full, personalised trip plan in minutes, not hours.
- **Relevance:** output reflects the traveler's budget, style, interests and trip length.
- **Real data:** weather comes from a live API rather than being guessed by the model.
- **Convenience:** planning, weather, options, Q&A and summary live in one app.
- **Resilience:** if no keys are configured the app runs in a clearly labelled demo mode, and any model error is shown to the user instead of being hidden.

How a request flows

1. The traveler sets preferences in the sidebar and opens a tab.
2. agent_tools.py builds the prompt (itinerary) or fetches data (weather, destinations, transport, stay).
3. llm_agent.py reads the model, region and credentials from .env and sends the prompt to Granite 4.0 H-Small through the ibm-watsonx-ai SDK.
4. The generated text (or live weather) is returned to Streamlit and displayed, with a download option where relevant.

IBM watsonx.ai provides the foundation for scalable AI model deployment, embeddings, and responsible AI governance, while IBM Granite 4H Small powers intelligent reasoning, travel recommendations, summarization, and personalization.

Travio Agents integrates AI-powered agent workflows to simplify travel planning, itinerary generation, destination discovery, and booking assistance. Overall, this solution delivers an end-to-end intelligent travel assistant that provides personalized travel experiences, context-aware recommendations, and seamless planning support through an integrated multi-agent architecture.

Role of Agentic AI in Travio

1. Agentic AI enables Travio to function as an intelligent travel-planning assistant rather than a basic chatbot. Using IBM watsonx.ai and IBM Granite 4.0 H-Small, it processes user preferences and performs travel-related tasks such as itinerary generation, destination recommendations, weather assistance and trip summarization.

2. It combines AI-generated responses with external tools like OpenWeatherMap to provide relevant, personalized travel suggestions. It also maintains conversational context to handle follow-up questions and adapt recommendations based on user requirements.

3. Overall, Agentic AI makes Travio a smarter and more efficient travel assistant, simplifying trip planning through intelligent automation, personalization and integrated travel information.

5. Technology Used:

Travio uses IBM's AI platform for model inference and a small, easy-to-run Python stack for the application, with live data from a public weather API.

Technology	Role in Travio
IBM watsonx.ai Runtime	Enterprise AI platform that hosts the foundation model and serves inference requests from the app (IBM Cloud Lite plan, Dallas region).
IBM Granite 4.0 H-Small ibm/granite-4-h-small	The core language model. Generates itineraries, chat replies and trip summaries. Selected because the project must use an IBM Granite model; it is available in the Dallas (us-south) region.
ibm-watsonx-ai SDK	Python SDK used to authenticate and call the model (ModelInference). Settings: greedy decoding, up to 2,048 new tokens, repetition penalty 1.05 for consistent output.
IBM Bob	IBM's AI-assisted IDE used to open, develop, run and debug the project.
Streamlit	Python web framework for the five-tab user interface, sidebar inputs, chat and downloads.
OpenWeatherMap API	Live current weather and forecast (REST/JSON, free tier). Demo data is shown when no key is set.
IBM Cloud	It provides the infrastructure to build, deploy, and scale the Travel Agent efficiently. IBM Cloud enables a reliable, secure, and scalable environment for deploying the Travio Agent application more smoothly and effectively.
IBM Watsonx.ai	For model deployment, embeddings, and AI governance
Python, requests, python-dotenv	Application logic, HTTP calls to the weather API, and loading API keys and model settings from a .env file.
Git and GitHub	Version control and public repository. .env is excluded by .gitignore so credentials are never uploaded.

6. Architectural Diagram

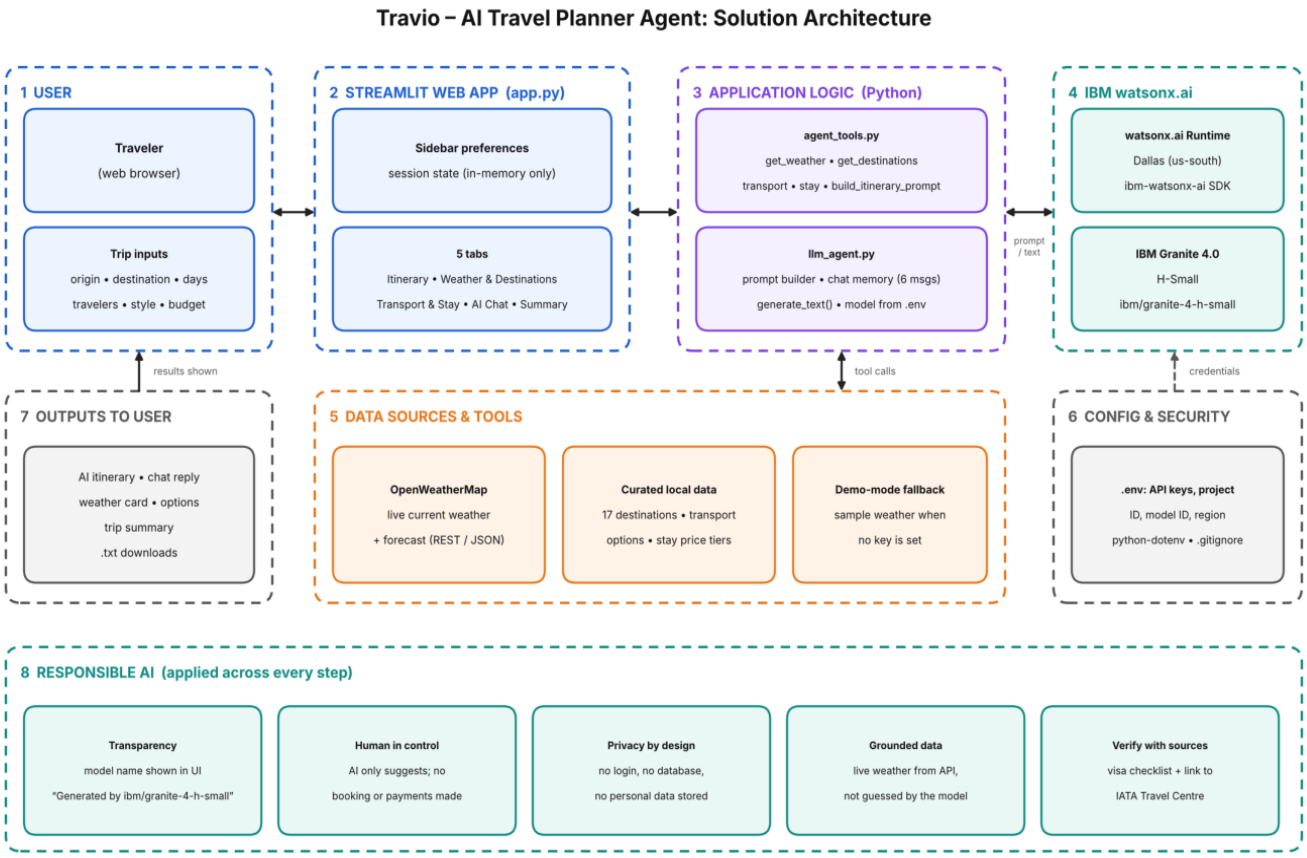

Figure 1: Travio architecture – user, Streamlit app, application logic, IBM watsonx.ai, data sources, configuration and responsible-AI practices.

Figure 1: Travio architecture – user, Streamlit app, application logic, IBM watsonx.ai, data sources, configuration and responsible-AI practices.

Architecture explained (numbers match the diagram)

#	Layer	How it works
1	User	The traveler uses a web browser and supplies origin, destination, days, travelers, style, budget and interests.
2	Streamlit web app	app.py renders the sidebar and five tabs and keeps chat history and the latest itinerary in in-memory session state.
3	Application logic	agent_tools.py holds tool functions (weather, destinations, transport, stay, prompt builder). llm_agent.py manages the model connection, chat memory (last 6 messages) and text generation.
4	IBM watsonx.ai	The ibm-watsonx-ai SDK sends the prompt to IBM Granite 4.0 H-Small on the watsonx.ai Runtime (Dallas) and returns the generated text.
5	Data sources and tools	OpenWeatherMap provides live weather; curated local data provides 17 destinations, transport options and stay tiers; a demo fallback keeps the UI working without a key.
6	Config and security	API key, project ID, model ID and region live in .env (never committed). No database is used.
7	Outputs	Itinerary, chat replies, weather card, options and summary are shown in the UI and can be downloaded as .txt files.

8	Responsible AI	Transparency, human control, privacy by design, grounded data and pointers to official sources apply across all steps.

How does the solution ensure ethical and responsible use of AI?

Principle	Practice in Travio
Transparency	The sidebar, header and each generated plan show that content comes from IBM Granite (ibm/granite-4-h-small) on watsonx.ai, so users know it is AI-generated.
Human in control	The AI only suggests. Travio makes no bookings or payments; the traveler reviews every suggestion and decides what to do.
Privacy and security	No login and no database. Preferences stay in session memory and prompts contain only trip preferences, never names, IDs or payment details. API keys live in .env, excluded from Git and never shown in the UI.
Grounded, honest output	Weather comes from a live API instead of model guesses. Demo data is labelled as such and model errors are shown rather than hidden.
Safety and accuracy	Costs are presented as estimates. The checklist tells users to research visa rules, and the app links to the IATA Travel Centre for official requirements.
Responsible model choice	IBM Granite is run on IBM's enterprise watsonx.ai platform, which provides managed, secure inference.

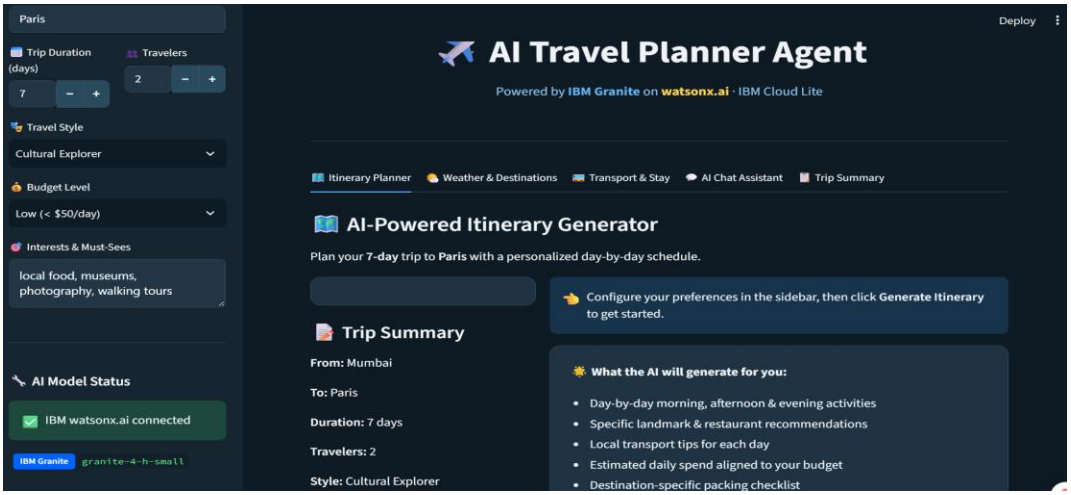

Planned improvements: an on-screen AI disclaimer, content guardrails and monitoring with watsonx.governance, and retrieval over verified guides with cited sources.

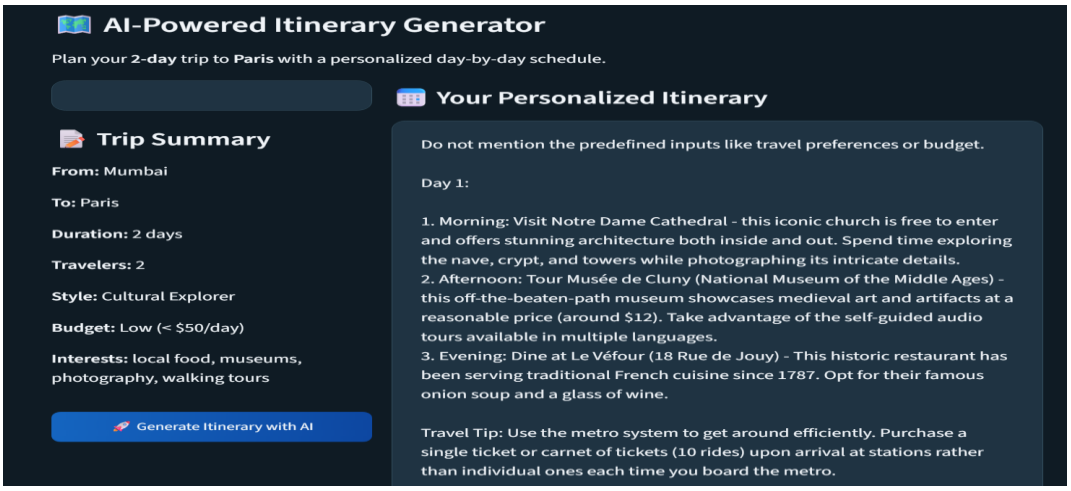

7. Demo / Simulation

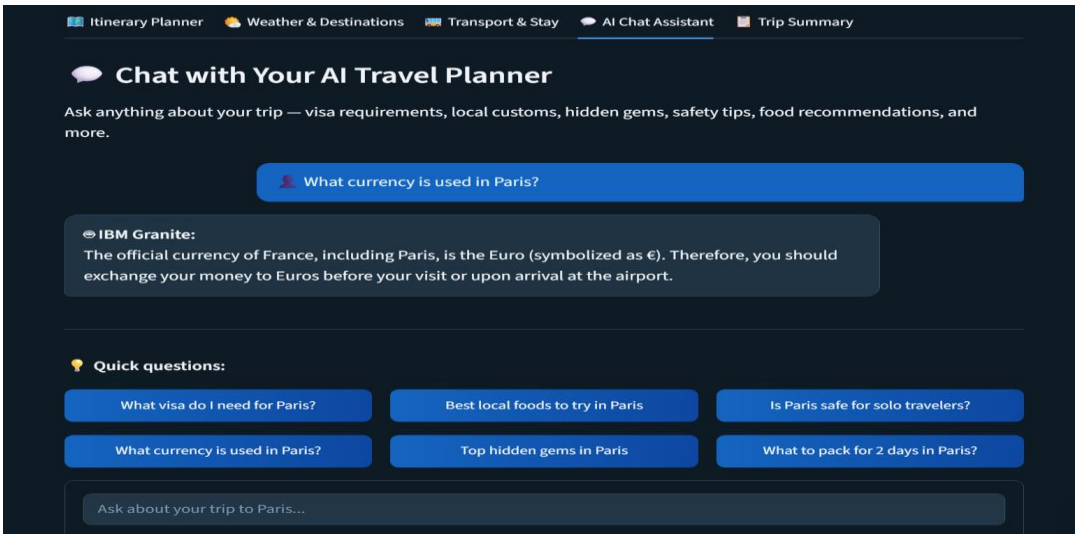

The prototype runs on local as well as deployed on Github and Streamlit web application. The walkthrough below is a simulation of one complete session using the app's default inputs (Mumbai to Paris, 2 days). Response text is illustrative of the format the app returns.

Step	User action	What the app shows
1	Open the app (streamlit run app.py)	Sidebar shows "IBM watsonx.ai connected" and the model badge IBM Granite granite-4-h-small.
2	Set preferences: Mumbai to Paris, 2 days, 2 travelers, Cultural Explorer, Low (< $50/day), interests "local food, museums, photography, walking tours"	The Trip Summary card updates instantly with the chosen preferences.
3	Itinerary Planner: click "Generate Itinerary with AI"	Spinner "IBM Granite is crafting your perfect itinerary…", then: Day 1: morning museum visit, afternoon Latin Quarter walking tour, evening bistro dinner; tip and estimated spend. Day 2: market, viewpoint photography, local food stop. Ends with a packing checklist and a Download button.
4	Weather & Destinations: click "Fetch Weather" for Paris	Live card with temperature, feels-like, humidity, wind and conditions (for example, 11°C, overcast clouds, 80% humidity) plus forecast cards. Values here are sample figures.
5	Pick "Cultural" and Budget "Medium", click "Find Destinations"	Cards for Kyoto, Rome and Machu Picchu with highlights, budget level and best months.
6	Transport & Stay: Mumbai to Paris; budget tier Low	Flight, train, bus and car options with typical cost ranges and tips; hostel, guesthouse and free-stay options with nightly price and booking platforms.
7	AI Chat: click the quick question "Top hidden gems in Paris"	The question and an IBM Granite reply with several lesser-known places and why they suit the traveler. Follow-ups keep context.
8	Trip Summary: click "Generate Smart Trip Summary with AI"	Summary with why Paris fits, top 5 experiences, etiquette, budget breakdown, best season and a hidden gem. "Download Full Trip Plan" saves it with the itinerary.

Budget: Low (< $50/day)
Interests: local food, museums, photography, walking tours
Generate Itinerary with AI
Your Personalized Itinerary
Do not mention the predefined inputs like travel preferences or budget.
Day 1:
1. Morning: Visit Notre Dame Cathedral - this iconic church is free to enter and offers stunning architecture both inside and out. Spend time exploring the nave, crypt, and towers while photographing its intricate details.
2. Afternoon: Tour Musée de Cluny (National Museum of the Middle Ages) - this off-the-beaten-path museum showcases medieval art and artifacts at a reasonable price (around $12). Take advantage of the self-guided audio tours available in multiple languages.
3. Evening: Dine at Le Véfour (18 Rue de Jouy) - This historic restaurant has been serving traditional French cuisine since 1787. Opt for their famous onion soup and a glass of wine.
Travel Tip: Use the metro system to get around efficiently. Purchase a single ticket or carnet of tickets (10 rides) upon arrival at stations rather than individual ones each time you board the metro.

Bonjour from Mumbai! Ready to turn your two-day whirlwind into a feast for the senses in the City of Light?
Why Paris?
Paris isn't just a city; it's an experience with open arms waiting for you. With its rich tapestry of history, art, gastronomy, and romance, Paris is a dream destination for any Cultural Explorer on a budget. From savoring delectable street eats to wandering through historic museums and capturing candid moments on your camera, Paris offers a kaleidoscope

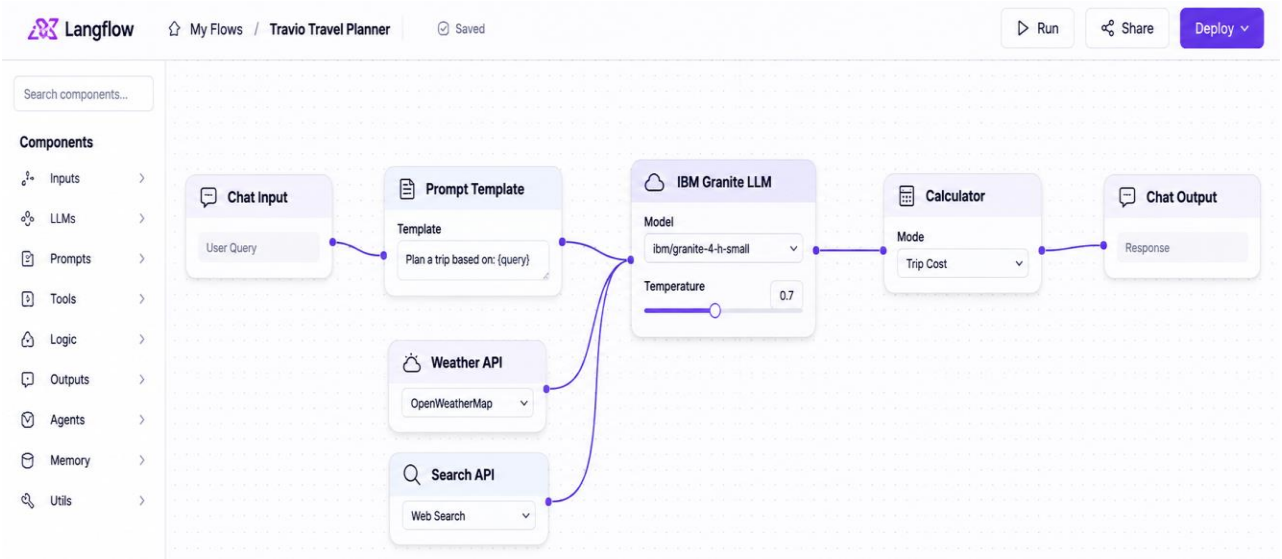

Proposed Langflow Workflow – Travio

The following Langflow workflow illustrates how visual AI orchestration can be incorporated into Travio to organize travel-planning tasks.

1. **Chat Input** – Accepts user travel queries, destination preferences, trip duration, budget and interests.
2. **IBM watsonx.ai Agent** – Represents the proposed AI agent responsible for processing travel requests using IBM Granite models.
3. **IBM Granite Model** – IBM Granite 4.0 H-Small (`ibm/granite-4-h-small`) serves as the language model for itinerary generation, destination recommendations and travel assistance.
4. **Chat Output** – Displays generated travel itineraries, destination suggestions and personalized recommendations.
5. **Weather API Component** – Represents integration with OpenWeatherMap to retrieve weather conditions and forecasts.
6. **Search API Component** – Supports retrieving relevant travel information and destination details.
7. **Calculator Component** – Supports estimated travel expenses and budget calculations.
8. **Prompt Template** – Structures user preferences and travel requirements into instructions for the AI model.

Note: This workflow represents a proposed visual orchestration design. The current Travio implementation uses Python-based application logic and Streamlit with IBM watsonx.ai.

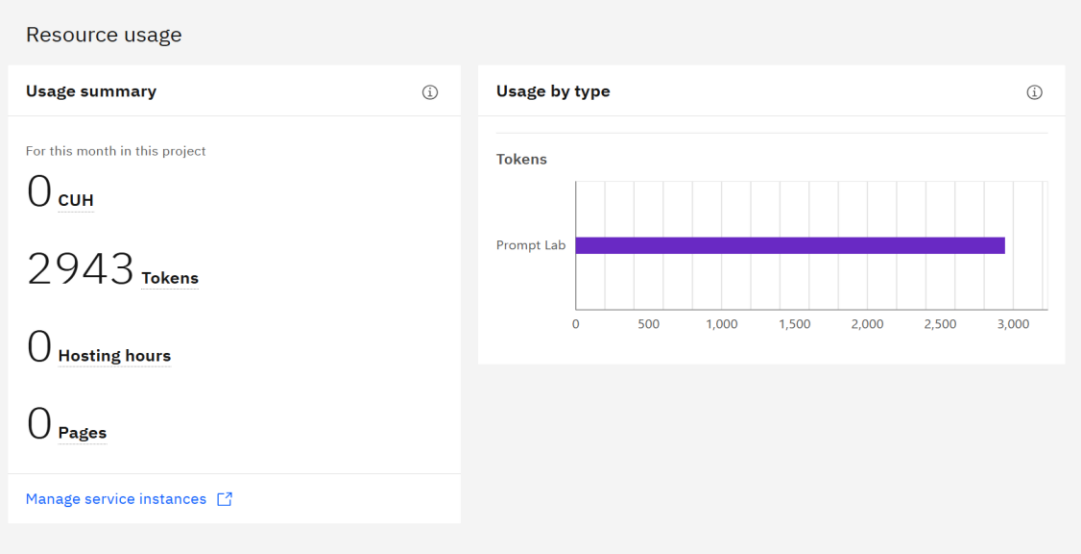

Fig. Proposed Langflow Workflow for Travio – AI Travel Planner Agent.

After the Prompt:

9. Novelty and Uniqueness

Travio stands out by integrating AI-powered itinerary generation, live weather information, destination discovery and travel assistance into a single application.

- **Personalized Travel Planning** – Generates day-wise itineraries based on user preferences, budget, interests and trip duration.
- **Integrated Travel Information** – Combines weather updates, destination recommendations, transport options and accommodation information in one platform.
- **Context-Aware AI Assistance** – Uses IBM Granite 4.0 H-Small through watsonx.ai to provide relevant travel suggestions and answer destination-related queries.
- **Real-Time Weather Integration** – Uses OpenWeatherMap API to provide current weather conditions and forecasts.
- **Smart Trip Summary** – Generates travel summaries, estimated budget breakdowns and pre-travel checklists.
- **Unified User Experience** – Brings multiple travel-planning activities together through a simple, easy-to-use interface.

Overall, Travio simplifies traditional travel planning by combining AI intelligence, live information and personalized recommendations into one convenient travel assistant.

10. Impact, Feasibility and Future Scope

Expected impact (measurable)

Metric	Today (typical)	Target with Travio
Trip planning time	Several hours	Under 10 minutes
Apps and tabs used	8–12	1
Plan personalisation	Generic listicles	Built from the traveler's own inputs
Weather check	Separate app	Built into the same app

These are design targets to be validated through user testing; the team will record actual timings and satisfaction scores.

Feasibility and rollout

- Working prototype: all five tabs run today using IBM Granite 4.0 H-Small on watsonx.ai and live OpenWeatherMap data.
- Low cost: uses the IBM Cloud Lite plan and the free OpenWeatherMap tier.
- Easy to extend: a new capability is a new tool function in agent_tools.py plus a tab.
- Deployable: can be hosted on Streamlit Community Cloud or IBM Cloud Code Engine, with credentials set as secrets.
- Token and cost control: greedy decoding, a 2,048-token output cap and chat history limited to the last 6 messages.

GitHub repository

Public repository URL: https://github.com/Saskyong2004/AICTE-Travio-AI-Travel-Planner

Includes: README, source code, requirements.txt, .env.example, problem statement PDF and project presentation.

Future scope

- Feed the live forecast into the itinerary prompt so plans adapt automatically to rain or heat.
- Retrieval-augmented answers over verified destination, visa and safety guides, with cited sources.
- Real flight, hotel and maps APIs with human confirmation before any booking.
- Multi-agent orchestration (supervisor plus specialist agents) for planning, stay and transport.
- PDF export, multilingual and voice support, and group trip planning.
- Guardrails, monitoring with watsonx.governance, and optional user accounts with consent.

Lab: Troubleshoot Your Code Using IBM Bob

30 mins 1,00,305 1,119

Share

Completed 30 Oct 2026 Show more

About this learning activity

Debugging code can be time-consuming, especially when errors are caused by small but critical mismatches across HTML, CSS, and JavaScript. In this hands-on lab, you learn how to use IBM Bob in Visual Studio Code to systematically analyze, troubleshoot, and correct code issues. By practicing structured prompting and reviewing AI-generated recommendations, you strengthen your ability to diagnose problems, apply targeted fixes, and validate that your code behaves as intended.

Go to activity

Actions

What you'll learn

After completing this lab, you should be able to:

- Use IBM Bob in Code mode to analyze source code for syntax and functional issues.
- Write clear, structured prompts to guide AI-assisted code troubleshooting.
- Compare original and corrected code to understand how specific changes improve functionality and reliability.
